

## Students learn by "doing" standards-based, hands-on activities.

Students learn by "doing" standards-based, handson activities. Technology and engineering students learn by doing more than science and mathematics students. This finding may not surprise some educators. It is, however, important to realize that "millions of American youth spend precious little time tinkering, troubleshooting, or doing the kinds of hands-on problem-solving that are at the heart of technology and engineering" (Change the Equation, 2016, p. 1). Equally important is realizing that "people who are not literate in engineering and technology are too often doomed to be replaced by the technologies they cannot command." (Change the Equation, 2016, p. 2). By doing in the classroom, technology and engineering students learn to "apply knowledge to new situations, to identify and solve unexpected problems without a playbook, [and] learn through ingenuity, failure, and perseverance" (Change the Equation, 2016, p. 2).

The purpose of the Learn Better by Doing Study was to determine the extent to which U.S. public elementary, middle,
and high school students were doing hands-on activities in their science, technology, engineering, and mathematics (STEM) classrooms. ITEEA's Foundation for Technology and Engineering Education (FTEE), Dugger/Gerrish endowment provided support for this study.

This article will frequently refer to the Change the Equation study titled, Vital Signs: Reports on the Condition of STEM Learning in the U.S. The study reports results of the National Assessment of Educational Progress, Technology and Engineering Literacy (NAEPTEL) Assessment administered to over 21,000 eighth grade students in 2014. The document discusses the importance of technology and engineering literacy and provides "concrete strategies for ensuring widespread literacy in technology
by
Johnny J Moye, DTE,
William E.
Dugger, Jr,
DTE, and
Kendall N .
Starkweather, DTE
and engineering" (Change the Equation, 2016, p. 9). It is important for education leaders to understand that the Learn Better by Doing Study addresses many of the concerns stated in the Vital Signs document.

This article presents data collected from the fourth and final Round of a longevity study on learning better by doing. The four rounds of the study were:

- Round 1,2013-2014
- Round 2, 2014-2015
- Round 3,2015-2016
- Round 4, 2016-2017

The authors present the implication of each finding, why they are important, and conclude with a call to action. The final report includes information gleaned from all four Rounds of the study.

The researchers solicited input from elementary, middle, and high school STEM teachers concerning standards-based activities that their students could have potentially done in their classrooms. Teachers were asked to respond "Yes" or "No" to 13 statements. The first two statements asked teachers if they felt that students learned by doing hands-on activities in class and whether they would have their students do more in class if they had the time and resources. The remaining 11 statements were grade-level specific (elementary, middle, and high school) and based on Standards for Technological Literacy: Content for the Study of Technology (STL) (ITEA/ITEEA, 2000/2002/2007), Next Generation Science Standards (NGSS) (Achieve, 2013a), and Common Core State Standards for Mathematics (CCSSfM) (CCSSO, 2010). Moye, Dugger, and Starkweather 2014a, and 2014b provide the methodology used in this study.

The researchers emailed surveys to approximately 30,000 elementary and secondary STEM teachers. Teacher participation was also encouraged by promotions in the STEM Connections newsletter, ITEEA conference promotions, ITEEA website, and personal researcher/teacher interaction.

## Findings

The first general statement asked teachers if they felt that students benefit from doing activities to support learning. The second statement asked if they would assign their students more class projects if they had the time and resources. The total number of responding teachers was 1,840 , including 327 elementary, 509 secondary science, 636 secondary technology and engineering, and 368 secondary mathematics teachers. Overwhelmingly, 99.4\% of respondents felt that students benefit from doing activities, and $94.5 \%$ would have students do more in class if they had the time and resources. Table 1 identifies the

Table 1. Rounds 1, 2, 3, and 4 General Statements, Number of "Yes" Responses/Total Responses, and Percentages of "Yes" Responses.

| 12. ...built something designed to meet specific criteria and constraints. | $\begin{gathered} 217 / 365 \\ 59.5 \% \end{gathered}$ | $\begin{gathered} 131 / 243 \\ 53.9 \% \end{gathered}$ | $\begin{gathered} 106 / 155 \\ 68.4 \% \end{gathered}$ | $\begin{gathered} \text { 180/275 } \\ 65.5 \% \end{gathered}$ |
| 13. ...used a computer program to model and simulate a solution to a problem. | $\begin{gathered} 80 / 365 \\ 21.9 \% \end{gathered}$ | $\begin{gathered} \text { 60/243 } \\ 24.7 \% \end{gathered}$ | $\begin{aligned} & 35 / 155 \\ & 22.6 \% \end{aligned}$ | $\begin{aligned} & 64 / 275 \\ & 23.3 \% \end{aligned}$ |
| Total Yes Responses/Total Responses and Percentage of Doing in Courses | $\begin{gathered} 1927 / 4015 \\ 48 \% \end{gathered}$ | $\begin{gathered} 1339 / 2673 \\ 50.1 \% \end{gathered}$ | $\begin{gathered} 932 / 1705 \\ 54.7 \% \end{gathered}$ | $\begin{gathered} 1672 / 3025 \\ 54.8 \% \end{gathered}$ |

two general statements, the number of teachers who responded "Yes," the total number of responses, and percentage of "Yes" responses for both statements in all four Rounds.

In addition to the two general statements, elementary, middle, and high school instruments contained 11 standards-based statements appropriate for each of the three grade levels. Teachers were also asked to respond "Yes" or "No" to those statements.

In Round 4, 275 elementary teachers responded to grade-level statements 3 through 13. The total percentage of students doing activities was $54.8 \%$. Table 2 identifies elementary school statements 3 through 13, the number of teachers who responded "Yes," the total number of respondents, and the percentage of teachers indicating "Yes" to each statement. Elementary-level data for Rounds 1 through 4 are included. The last row of the table contains the number of "Yes" responses/total responses and percentages of doing at the elementary school level. The researchers derived the percentages by adding the number of "Yes" responses in the elementary column divided by the total number of responses in the same column.

A total of 514 middle school teachers responded to middle school statements 3 through 13. Of those respondents, 189 were science, 215 technology and engineering, and 110 were mathemat-
ics teachers. Table 3 identifies middle school statements, the number of teachers who responded "Yes," the total number of responding teachers, and the percentage of teachers indicating "Yes" to each statement. Middle school level data for Rounds 1, 2, 3 , and 4 are included. The last row of Table 3 contains the number of "Yes" responses/total responses and percentages of doing in courses. The researchers derived these percentages using the same procedure as with the elementary data.

At the high school level, 853 teachers responded in this Round, of which 282 were science, 366 technology and engineering, and 205 mathematics. Table 4 identifies high school statements 3 through 13, the number of teachers who responded "Yes," the total number of responding teachers, and the percentage of teachers indicating "Yes" to each statement. High school level data for Rounds 1 through 4 are included. The last row of the table contains the number of "Yes" responses/total responses, and percentages of doing in courses. The researchers used the same procedure as with the elementary and middle school data to determine the percentage of doing at the high school level. In order to determine the secondary percentage of doing, the researchers combined the middle and high school data for each secondary level content area. The total number of responding secondary teachers in Round 4 was 1367, of which 471 were science, 581 technology and engineering, and 315 mathematics.

Table 3. Rounds 1, 2, 3, and 4 Middle School Statements, Number of "Yes" Responses/Total Responses, and Percentage of "Yes" Responses.

Based on Round 4 teacher responses, the percentage of secondary science doing was $59.1 \%$, technology and engineering $77.2 \%$,
and mathematics $33.3 \%$. Figure 1 contains elementary and secondary percentages for each round as well as four-year averages.

## Discussion

The purpose of the Learn Better by Doing Study was to determine the extent to which U.S. public elementary, middle, and high school students were doing hands-on activities in their STEM classrooms. The researchers asked elementary and secondary STEM teachers to respond "Yes" or "No" to 13 statements. The first two statements asked teachers if they felt that students learn by doing hands-on activities in class and if they would have their students do more in class if they had the time and resources. The remaining 11 statements were based on Standards for Technological Literacy (STL), Next Generation Science Standards (NGSS), and Common Core State Standards for Mathematics (CCSSfM).

In this (fourth) Round, 1835 of the 1840 (99.7\%) responding teachers felt that students benefit from doing activities. The majority (1698 of 1840-92.3\%) of those teachers indicated that they would have their students do more activities in class if they had the time and resources. Such a large percentage of teach-
ers responding "Yes" to those two statements supports the idea that students learn better by doing. If students do learn better by doing, it stands to reason that they should be doing more standards-based, hands-on activities in their classrooms.

Again in Round 4, the secondary technology and engineering percentage of doing is higher than elementary, secondary science, and secondary mathematics percentages. This finding is consistent with the findings in each round. Although this report focuses on Round 4 information, it is interesting to see that the lowest secondary technology and engineering percentage, $73.6 \%$ recorded in 2016, is $14.5 \%$ higher than the next highest percentage of $59.1 \%$ found in secondary science in 2017. Based on this data, technology and engineering students are consistently doing more hands-on activities in their classrooms.

The statements teachers responded to can be grouped into different categories; for example, designing and modeling. When
examining those two categories, specific trends and opportunities become evident.

Learning an engineering design process is beneficial for students' understanding of and ability to apply information. By using a design process, students "can integrate various skills and types of thinking-analytical and synthetic" (Katehi, Pearson, \& Feder, 2009, p. 37).

In Round 4, teachers report that technology and engineering students used a design process $23.4 \%$ more frequently than science students and $44.1 \%$ more than mathematics students. Six statements reflecting design processes were used to make this determination. Those statements were middle school statements 9 , 11, and 13 in Table 3 and high school statements 5, 10, and 13 contained in Table 4.

STL, NGSS, and CCSSFM all identify the importance of students learning by creating models. Referring to students who took the 2014 NAEP-TEL Assessment, the Change the Equation Vital Signs document identified that opportunities to build models "are few and far between for most students" (Change the Equation, 2016, p. 4).

In Round 4, teachers report that technology and engineering students model $18.6 \%$ more than science students and $52.1 \%$ more than mathematics students. Middle school statements 4,6 , and 8 in Table 3 and high school statements 4, 6, \& 11 in Table 4 were used to make this determination.

Students in all three content areas are doing design and modeling activities in their classrooms. Since this is the case, the reader can recognize how STEM teachers could collaborate to create integrated lessons and assessments using design and modeling activities. Students receiving integrated studies and performing hands-on activities reinforcing those studies represent the epitome of STEM education.

Regardless of the low percentages, mathematics students are also using design and modeling as a doing activity. Mathematics teachers reported that their students completed design and modeling activities ranging from $12.2 \%$ to $55.4 \%$. Clearly, mathematics can be and should be integrated into activities students do in science, technology, and engineering classrooms.

The National Mathematics Advisory Panel identified that a "sharp falloff in mathematics achievement in the U.S. begins as students reach late middle school" (NMAP, 2008, p. xiii). In addition to the "falloff in mathematics" students become less interested in education while in high school (NRC-IM, 2004). Moye, Dugger, and Starkweather (2016) reported that hands-on activities decreased between middle and high school. This decrease was again found

in Round 4. The question still remains, "could there be a correlation between the amount of doing and student interest in school?" (Moye, Dugger, \& Starkweather, 2016, p. 21).

NGSS identifies three categories of school resources. The first, material resources, "include time available for teaching, professional development, and collaboration among teachers [as well as] curricular materials, equipment, supplies, and expenditures." The second resource, human capital, includes "individual knowledge, skills, and expertise." The third identified resource is social capital, which stresses the need for "collaboration among teachers of different specializations and subject areas beyond the traditional forms of collaboration" (Achieve, 2013b, p. 33).

Teachers want their students to do more hands-on activities but have limited time and resources. Technology and engineering labs and classrooms contain STEM education material resources such as curricula, equipment, and supplies necessary to learn and practice STEM. Technology and engineering teachers are a source of human capital, possessing the knowledge, skills, and expertise that can help science and mathematics teachers learn and practice the art of integrative studies. Science and mathematics teachers could better utilize the social capital available by collaborating and performing collective decision making with technology and engineering teachers.

## Conclusion - A Call to Action

The Learn Better by Doing Study has concluded, but this work is not complete. Technology and engineering professionals should now deliver the results to a broad audience that will better understand the importance of technology and engineering courses and programs. Often studies are conducted, only to be published with very little action taken based on the results. For example, the Change the Equation Vital Signs document states, "Decades of research suggests that people often learn best by testing solu-

## learn better by doing study-fourth-year results

tions to real-world problems through hands-on trial and error. If the TEL survey results are any indication, [previous] research has had little impact on the nation's schools" (Change the Equation, 2016, p. 4). Technology and engineering professionals must take action on this study.

It is critical that people know how to apply knowledge in today's technologically driven society. Students must learn science, technology, engineering, and mathematics as well as be able to apply that information in daily situations. The U.S. education system has the resources needed to produce STEM-literate students. It is not evident, however, how all available resources are being used in the most productive manner. It is also not evident that technology and engineering programs are being utilized to strengthen STEM education in our schools.

With the assistance of the 5,910 teachers who participated in this four-year study, we now know where students are doing handson activities. Researchers are encouraged to glean information from the data provided in this study and publish key information supporting the need for and benefits of technology and engineering programs. Learning by doing is as vital to a student's education as cognitive learning is in today's technological world.

ITEEA has compiled all Learn Better by Doing Study articles and presentations at www.iteea.org/Activities/2142/Learning Better by Doing Project/50026.aspx\#tabs.

Johnny J Moye, Ph.D., DTE is a retired U.S. Navy Master Chief Petty Officer, a former high school technology teacher, and a recently retired school division CTE Supervisor. He currently serves as an adjunct professor with Old Dominion University's STEMPS department. He can be reached at johnnyjmoye@gmail.com.

William E. Dugger, Jr., Ph.D., DTE served as Director of ITEEA's Technology for All Americans Project, which developed the landmark Standards for Technological Literacy and Advancing Excellence in Technological Literacy documents. Dugger is an Emeritus Professor at Virginia Tech and serves as Senior Fellow for ITEEA. He can be reached at wdugger@iteea.org.

Kendall N. Starkweather, Ph.D., DTE, CAE is the former Executive Director/CEO of ITEEA. His career has focused on advancing technology and engineering education worldwide as a teacher, teacher educator, and association executive. He has worked for over four decades with determining direction and setting policy for the profession at the national and international levels. He is a distinguished graduate of the University of Maryland, Distinguished Technology and Engineering Educator, Certified Association Executive, and a member of ITEEA's Academy of Fellows.
